

# CSCE 551/MATH 562, Homework 1

## due Monday 1/29/2024

The numbered exercises are from the textbook, written out for the purpose of comparing your book version's exercises with mine. (Note: "state diagram" is the same as "transition diagram.") You must do the exercises as worded below.

**Exercise 1.4:** Each of the following languages is the intersection of two simpler languages. In each part, construct DFAs for the simpler languages, then combine them using the construction discussed in footnote 3 (page 46) to give the state diagram of a DFA for the language given. In all parts,  $\Sigma = \{a, b\}$ .

- c.  $\{w \mid w \text{ has an even number of } a\text{'s and one or two } b\text{'s}\}$
- e.  $\{w \mid w \text{ starts with an } a \text{ and has at most one } b\}$

**Exercise 1.5:** Each of the following languages is the complement of a simpler language. In each part, construct a DFA for the simpler language, then use it to give the state diagram of a DFA for the language given. In all parts,  $\Sigma = \{a, b\}$ .

- d.  $\{w \mid w \text{ is any string not in } a^*b^*\}$
- f.  $\{w \mid w \text{ is any string not in } a^* \cup b^*\}$

**Exercise 1.6:** Give state diagrams of DFAs recognizing the following languages. In all parts, the alphabet is  $\{0, 1\}$ .

- c.  $\{w \mid w \text{ contains the substring } 0101 \text{ (i.e., } w = x0101y \text{ for some } x \text{ and } y)\}$
- l.  $\{w \mid w \text{ contains an even number of } 0\text{'s or contains exactly two } 1\text{'s}\}$

**Exercise 1.7:** Give state diagrams of NFAs with the specified number of states recognizing each of the following languages. In all parts, the alphabet is  $\{0, 1\}$ .

- b. The language of Exercise 1.6c with five states
- c. The language of Exercise 1.6l with six states

**Exercise 1.16:** Use the construction given in Theorem 1.39 to convert the following two nondeterministic finite automata to equivalent deterministic finite automata.

b. [Given in tabular form:]

	a	b	$\varepsilon$
$\rightarrow 1$	{3}	$\emptyset$	{2}
*2	{1}	$\emptyset$	$\emptyset$
3	{2}	{2, 3}	$\emptyset$

**Not in Textbook 1:** Consider the DFA  $A$  (below left) over the alphabet  $\{0, 1\}$ :

1. Fill in the distiguishability table to the right with X in each entry corresponding to a pair of distinguishable states.
2. Draw (as a transition diagram) the minimal DFA equivalent to  $A$ .

**Not in Textbook 2:** Consider the following DFA  $A$  (given in tabular form):

	0	1
$\rightarrow *q_0$	$q_0$	$q_1$
$q_1$	$q_2$	$q_0$
$q_2$	$q_1$	$q_2$

Show that  $L(A)$  is the language of all binary representations of natural numbers that are multiples of 3. (Here we assume  $\varepsilon$  represents the number zero, which is a multiple of 3.) Hint: Prove the stronger statement that, for  $k \in \{0, 1, 2\}$ , the computation of  $A$  on input string  $w$  ends in state  $q_k$  iff  $w$  represents a number whose remainder is  $k$  when divided by 3. Make this argument by induction on  $|w|$ .
