Regular Expression Quick Reference v1.2

Literal Characters

\f	Form feed
\n	Newline
\r	Carriage return
\t	Tab
\v	Vertical tab
\a	Alarm (beep)
\e	Escape
\xHH	The ASCII character specified by the two digit hexadecimal code. For octal use \OOO except JS
\x{HHHH}	PHP: ASCII character represented by a four digit hexadecimal code. Javascript uses \uHHHH
\cX	The control character ^X. For example, \cI is equivalent to \t and \cJ is equivalent to \n

Repetition

{n,m}	Match the previous item at least n times but no more than m times.
{n,}	Match the previous item n or more times.
{n}	Match exactly n occurrences of the previous item.
?	Match zero or one occurrences of the previous item. Equivalent to {0,1}
+	Match one or more occurrences of the previous item. Equivalent to {1,}
*	Match zero or more occurrences of the previous item. Equivalent to {0,}
{}?	Non-greedy match - will not include the following group/match characters.
??	Non-greedy match - will not include the following group/match characters.
+?	Non-greedy match - will not include the following group/match characters.
*?	Non-greedy match. E.g. ^(.*?)\s*$ the grouped expression will not include trailing spaces.

Character Classes

[...]	Any one character between the brackets.
[^...]	Any one character not between the brackets.
.	Any character except newline. Equivalent to [^\n]
\w	Any word character. Equivalent to [a-zA-Z0-9_] and [[:alnum:]_]
\W	Any non-word character. Equivalent to [^a-zA-Z0-9_] and [^[:alnum:]_]
\s	Any whitespace character. Equivalent to [\t\n\r\f\v] and [[:space:]]
\S	Any non-whitespace. Equivalent to [^ \t\n\r\f\v] and [^[:space:]] Note: \w != \S
\d	Any digit. Equivalent to [0-9] and [[:digit:]]
\D	Any character other than a digit. Equivalent to [^0-9] and [^[:digit:]]
[\b]	A literal backspace (special case)

[[:class:]]	alnum	alpha	ascii	blank	cntrl	digit	graph
	lower	print	punct	space	upper	xdigit	

Options

g	Perform a global match. That is, find all matches rather than stopping after the first match.
i	Do case-insensitive pattern matching.
m	Treat string as multiple lines: ^ and $ match internal \n
s	Treat string as single line: ^ and $ ignore \n, but . matches \n
x	Extend your pattern's legibility with whitespace and comments.

Extended Regular Expression

(?#...)	Comment, "..." is ignored.
(?:...)	Matches but doesn't return "..."
(?=...)	Matches if expression would match "..." next
(?!...)	Matches if expression wouldn't match "..." next
(?imsx)	Change matching rules (see options) midway through an expression.

Replacement

\	Turn off the special meaning of the following character.
\n	Restore the text matched by the nth pattern previously saved by \(and \). n is a number from 1 to 9, with 1 starting on the left.
&	Reuse the text matched by the search pattern as part of the replacement pattern.
~	Reuse the previous replacement pattern in the current replacement pattern. Must be the only character in the replacement pattern. (ex and vi).
%	Reuse the previous replacement pattern in the current replacement pattern. Must be the only character in the replacement pattern. (ed).
\u	Convert first character of replacement pattern to uppercase.
\U	Convert entire replacement pattern to uppercase.
\l	Convert first character of replacement pattern to lowercase.
\L	Convert entire replacement pattern to lowercase.

Grouping

(...)	Grouping. Group several items into a single unit that can be used with *, +, ?, |, and so on, and remember the characters that match this group for use with later references.
|	Alternation. Match either the subexpressions to the left or the subexpression to the right.
\n	Match the same characters that were matched when group number n was first matched. Groups are subexpressions within (possibly nested) parentheses.

Anchors

^	Match the beginning of the string, and, in multiline searches (/m), the beginning of a line. PHP: Use \A to match beginning of string in all line matching modes.
$	Match the end of the string, and, in multiline searches (/m), the end of a line. PHP: Use \z and \Z to match the end of a string or end of text respectively.
\b	Match a word boundary. That is, match the position between a \w character and a \W character. (Note, however, that [\b] matches backspace.)
\B	Match a position that is not a word boundary.
