Weights

$$h = \sigma(W_1 x + b_1)$$

$$y = \sigma(W_2 h + b_2)$$

Activation functions

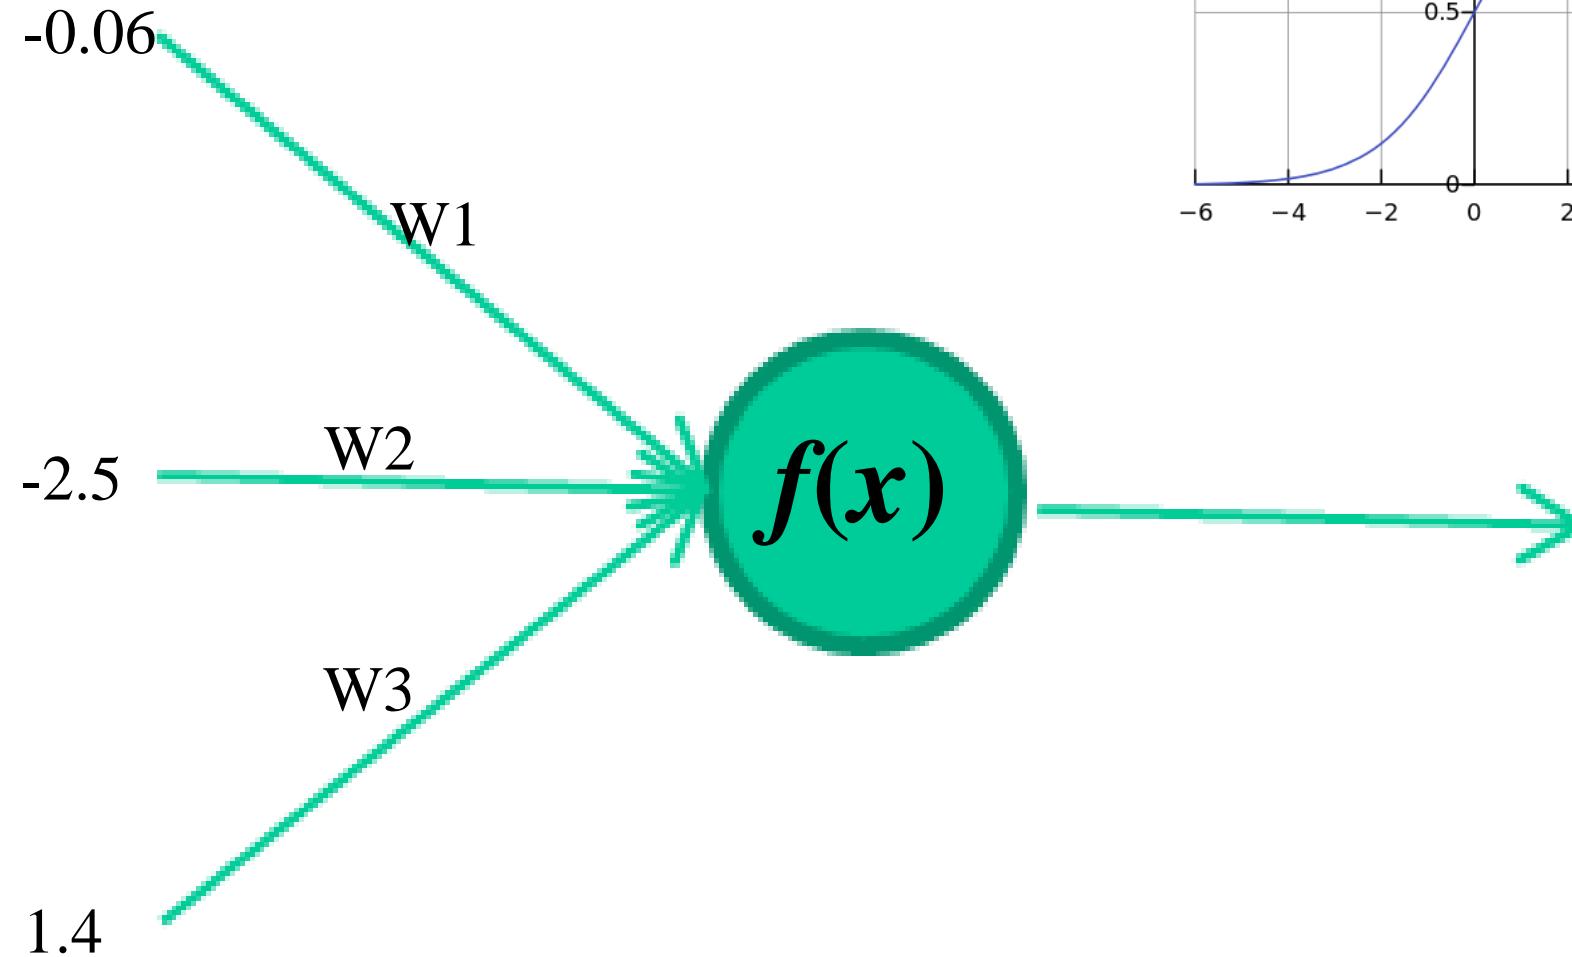

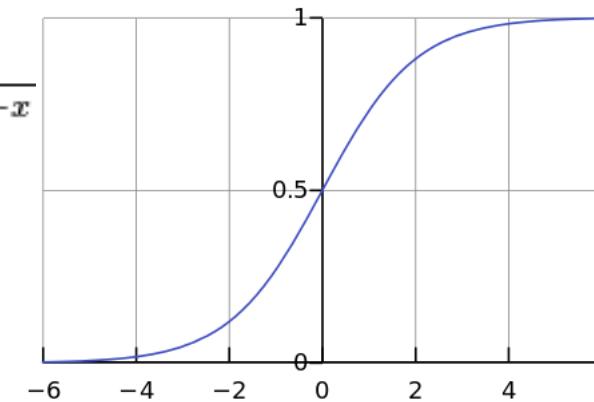

$4 + 2 = 6$ neurons (not counting inputs)

$$[3 \times 4] + [4 \times 2] = 20 \text{ weights}$$

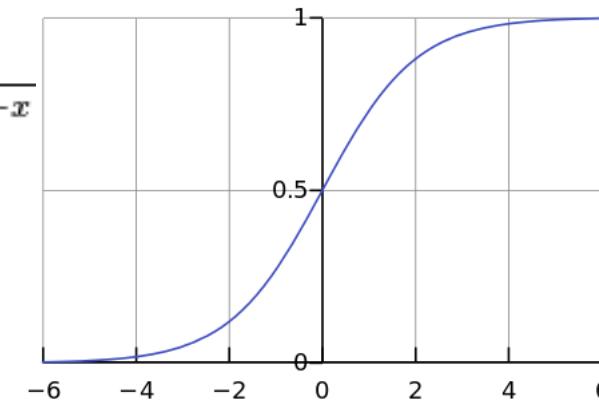

$$4 + 2 = 6 \text{ biases}$$

26 learnable parameters

$$f(x) = \frac{1}{1 + e^{-x}}$$

$$f(x) = \frac{1}{1 + e^{-x}}$$

And so on

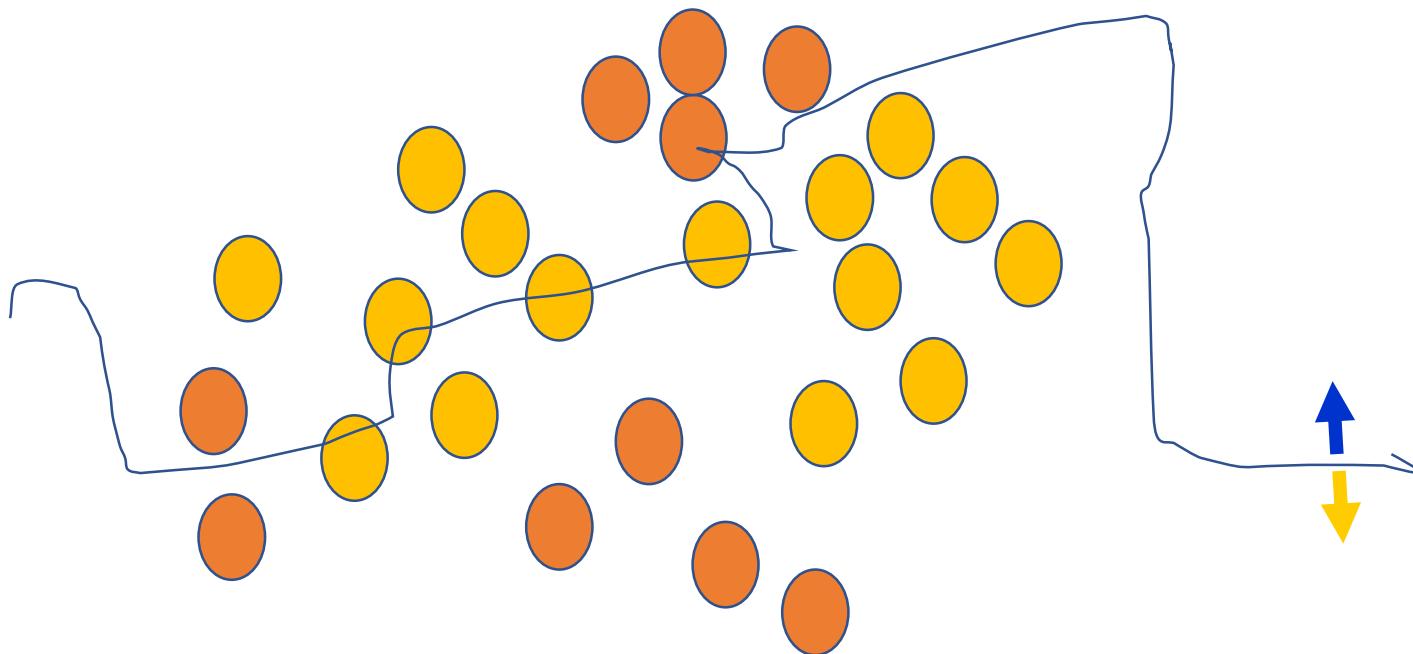

Repeat this thousands, maybe millions of times – each time taking a random training instance, and making slight weight adjustments

... until the weight adjustments are designed to make changes that will reduce the error

Eventually

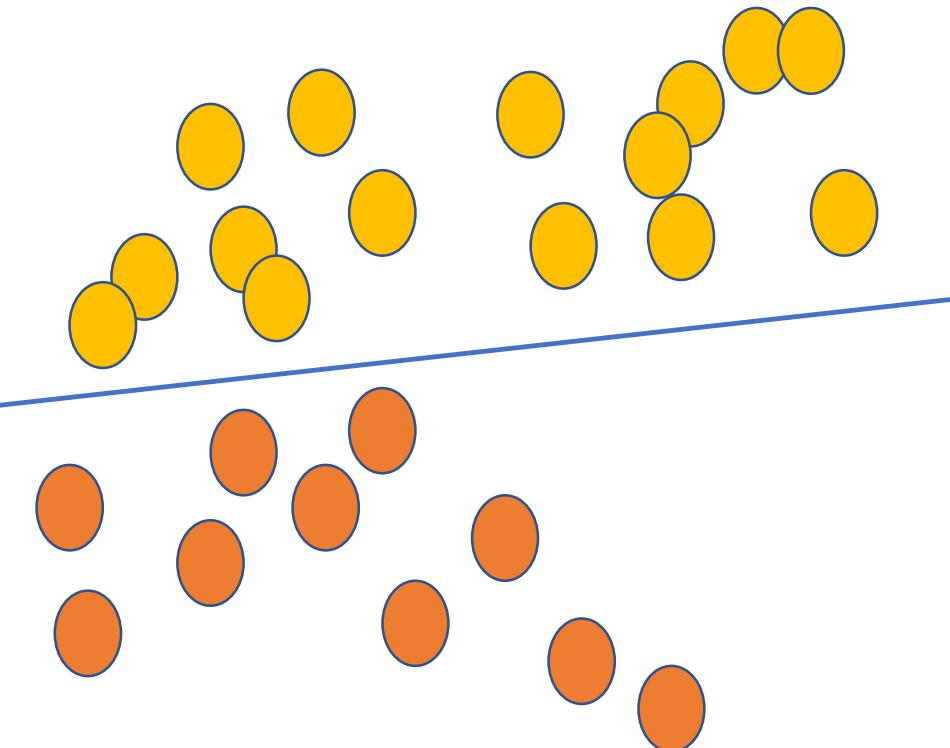

Some other ‘by the way’ points

NNs use nonlinear $f(x)$ so they can draw complex boundaries, but keep the data unchanged

SVMs only draw straight lines, but they transform the data first in a way that makes that OK

What features might you expect a good NN to learn, when trained with data like this?
